

SE – Overview of IT Industry

Name : Panchal Heer

Subject : Software Engineering-Overview of IT Industry

Session 2 – How Software Works

Software applications are built using different layers that work together to process user requests and manage data.

Task 1: Three Main Layers of Software Architecture

1.UI Layer :

Allows users to interact with the application.

2.Business Logic Layer :

Processes rules and application operations.

3.Database Layer :

Stores and manages application data.

Task 2: Define Client and Server

- **Client :**

A client is a device or application that requests information or services.

- **Server :**

A server is a system that processes requests and provides responses.

Example

Instagram App = Client

Instagram Server = Server

Task 3 : Differences Between Desktop, Web and Mobile Apps

Desktop App	Web App	Mobile App
Installed on a computer	Runs in a web browser	Runs on a smartphone
Can work offline	Usually requires internet	Uses mobile device features

Task 4 : Databases

Database	Type
MySQL	SQL
PostgreSQL	SQL
MongoDB	NoSQL

Conclusion :

This session explains software architecture , client-server communication , application types , and database technologies used in modern software systems.
